

## Forest Regeneration Flowchart

**Selection & Import** : Download and Select data from FOL and import to the connected database using DB manager

**Reproject** : Change the projection to NAD 1983 17 N for the required features using source SRID and Target SRID

**Clipping** : Clip the reprojected imported waterbody, roads and natural heritage features to the Southwest Middlesex & Newbury study area.

**Buffering** : A 100-metre buffer is drawn around clipped Natural Heritage Southwest Middlesex & Newbury

**Centroids** : Areas are identified for maximizing forest interior through a circle

**Centroid Buffer** : Radius field has been added, and circles are made

**Field Calculator** : Calculate the radius for each natural heritage polygon and total sum of total area

**Difference** : To identify Medium Priority Area by reducing clipped natural heritage from 100m buffer. For High Priority Area= Centroid buffer-clipped natural heritage.

**Dissolve and Final Output** : Total area of high and medium Forest Regeneration is generated by reducing 30m road buffer
